## 목통(Akebiae Caulis)의 화학성분과 AB42 저해활성

쵸두리 아니수짜만<br>지도교수 : 우 은 란<br>약학과<br>조선 대학교 대학원

목통(Akebiae Caulis) 은 으름덩굴( Akebia quinata Decaisne.) 또는 기타동속 식물의 줄기로 주피를 제거하고 가로로 자른 것으로 한방에서 소염, 이 뇨, 통경에 사용된다. 목통의 약리활성으로는 이뇨, 항진균, 위액분비 억 제, 지질저하 및 산후 유즙분비 촉진 작용 등이 알려져있다. 이전의 연구 에 의하면 목통 (Akebiae Caulis) 으로부터 triterpenes, triterpene glycosides, phenylethanoid glycosides, megastigmane glycoside 등을 비롯한 다양한 성분 이 분리, 보고되었다. 본 연구실의 예비실험결과 목통의 에틸아세테이트 분획이 $\mathrm{A} \beta-42$ 에 대한 저해 뛰어난 활성을 나타내 활성성분의 분리를 시 도하였다. 목통(Akebiae Caulis)의 에틸아세테이트분획에 대해 실리카겔, RP-18, MCI-gel, MPLC 컬럼크로마토그래피를 반복적으로 수행하여 9 개의 화합물: Pulsatilla saponin A (1), Collinsonidin (2), Akebonic acid (3), Hederagenin (4), 1-(3', 4'-dihydroxycinnamoyl) cyclopentane-2, 3-diol (5), Asperosaponin C (6), Leontoside A (7), Quinatic acid (8), and Quinatoside A (9) 을 분리했다. 화합물들 (1-9)의 구조는 ${ }^{1} \mathrm{H}-\mathrm{NMR},{ }^{13} \mathrm{C}-\mathrm{NMR},{ }^{1} \mathrm{H}-{ }^{1} \mathrm{HCOSY}$, $\mathrm{HSQC}, \mathrm{HMBC}$ 분광분석 등의 1 D 및 2 D NMR 에 기초하여 확인하였다. 분 리된 화합물 가운데 화합물 (5) 및 (6)은 목통에서 처음으로 분리된 화합 물들이다. 분리된 화합물에 대해, $\mathrm{A} \beta-42$ 유도 fibrillogenesis의 저해활성을

조사하였다. 화합물 중, 화합물2, $\mathbf{3}$ 및 6은 $\mathrm{A} \beta-42$ 유도 fibrillogenesis 대해 상당한 억제효과를 나타냈다. 본 연구에서는 목통으로부터 분리된 화합 물들에 대해A $\beta-42$ 저해효과여부를 처음으로 확인하였다.

키워드: 목통 (Akebiae Caulis); 으름덩굴; $\mathrm{A} \beta 42$

#### Abstract

\title{ Phytochemical constituents of Akebiae Caulis and their Aß42 inhibitory activities }

Md. Anisuzzaman Chowdhury<br>Advisor: Prof. Woo Eun-Rhan<br>College of Pharmacy<br>Graduate School of Chosun University

Akebia quinata DECAISENE (Lardizabalaceae) is a creeping woody vine that is widely distributed in East Asia, including Korea, China, and Japan. Traditionally, its dried stem is used mainly as a diuretic agent for the treatment of edema and rheumatic pain. Previous phytochemical investigations resulted in the isolation of triterpenes, triterpene glycosides, phenylethanoid glycosides and megastigmane glycoside. Amyloid $\beta(\mathrm{A} \beta)$, a main component of the senile plaque detected in Alzheimer's disease, induces cell death. However, a limited number of studies have addressed the biological and pharmacological effects of EtOAc fraction of Akebiae Caulis. In particular, the inhibitory activity against $A \beta-42$ induced fibrilogenesis of Akebiae Caulis remains unclear. In the present study, by means of repeated column chromatography using silicagel, LiChroprep RP-18, MCI-gel, and MPLC, nine compounds: Pulsatilla saponin A (1), Collinsonidin (2), Akebonic acid (3), Hederagenin (4), 1-(3', 4'-dihydroxycinnamoyl) cyclopentane-2, 3-diol (5), Asperosaponin C (6), Leontoside A (7), Quinatic acid (8), and Quinatoside A (9) was isolated from the Akebiae Caulis. The chemical structures of compounds (1-9) were identified based on 1D and 2D NMR, including H-H COSY, HSQC, and HMBC spectroscopic analyses. Compound 5 and 6 were isolated from this plant for the first time. For these isolated compounds, the inhibitory activities of $A \beta-42$
induced fibrilogenesis were examined. Among these isolated compounds, compound 2, 3, and 6 have significant inhibitory effects against $A \beta-42$ induced fibrilogenesis. This is the first report on the $A \beta-42$ inhibitory effects of the components from Akebiae Caulis

Key Words: Akebiae Caulis; Lardizabalaceae, $A \beta-42$, fibrilogenesis,

## 1. Introduction

### 1.1. The $\boldsymbol{\beta}$-Amyloid peptide and Alzheimer's disease

'Dementia'- the term is not a specific disease. It's a group of symptoms which affect mental tasks like loss of memory and other mental abilities. According to WHO (World Health Organization); approximately 47.5 million people around the world are living with dementia (Fig. 1) [1]. Alzheimer's disease (AD) is responsible for 60 to 70 percent of all cases of dementia [2]. AD characterized by progressive and insidious neurodegeneration of the central nervous system. The risk of developing Alzheimer's disease (AD) increase with the average age of 65 years or older [3].

Fig.1. Worldwide prevalence of Alzheimer's Disease 2000-2030
The principal neuropathological features of AD are the presence of intracellular neurofibrillary tangles and the senile plaques (extracellular deposition of amyloid beta $(A \beta)$ peptides). The third main feature of $A D$, which leads to diminished cell function and cell death by losing the connections between cells [4]. The peptide is derived from amyloid precursor protein (APP) (Fig. 2) by sequential cleavage of $\alpha$
,$- \beta-$, and $\gamma$ - secretases enzymes [5].

## Fig.2: amyloid precursor protein (APP) to Amyloid plaques.

In the general pathway, alpha-secretase cleaves the APP molecule within the portion that has highly potential to become beta-amyloid. The cleavage releases from the neuron, which is beneficial to promote neuronal growth and survival. At the end of the beta-amyloid segment, gamma-secretase cleaves the remaining APP fragment. In the malignant pathway, beta-secretase first cleaves the APP molecule at one end of the beta-amyloid peptide, and the resulting APP fragment cleaved by gamma-secretase. After that beta-amyloid peptide is released and begins to stick to other beta-amyloid peptides (Fig. 3). These small and soluble aggregates of several beta-amyloid peptides are called oligomers. It is probably that, some oligomers are
cleared from the brain. Those cannot be cleared that clump together with more beta-amyloid peptides, which grow larger and form protofibrils and fibrils. These increasingly insoluble forms combine to become the well-known plaques that are features of AD [4].

## Fig. 3: Releasing sAPPB from the cell and stick to other beta-amyloid peptides

Cleavage by $\gamma$-secretase is somewhat nonspecific, resulting in the formation of different C -terminal heterogeneous peptides. So, numerous different $\mathrm{A} \beta$ species exist, but those ending at position 40 ( $\mathrm{A} \beta 40$ ) are the most abundant ( $\sim 80-90 \%$ ), followed by 42 ( $\mathrm{A} \beta 42, \sim 5-10 \%$ ). The marginally longer forms of $A \beta$, specifically $A \beta 42$, are more hydrophobic and fibrillogenic, and are the principal species deposited in the brain $[6,7,8]$.

In the Alzheimer's brain; the cortex shrivels up, damaging areas involved in thinking, planning and remembering. Shrinkage is especially severe in the hippocampus, ventricles (fluid-filled spaces within the brain) grow larger (Fig. 4).

Fig.4: Comparison between normal brain and AD brain.
Because of its essential role in the Alzheimer's disease pathogenesis, the longer form of $A \beta$, (A $\beta 42$ ) is considered a major target for the study of its underlying mechanism of fibrilogenesis. Therefore, it is the primary goal of a number of therapeutic strategies under development or in clinical trials to prevent the assembly of $\mathrm{A} \beta$ monomer into toxic oligomer or fibril. Hence, major experiments have involved the establishment of compounds, which are capable of inhibiting or reversing the $A \beta$ aggregation process. Moreover, a number of diverse compounds including small molecules, antibodies, peptidic $\beta$-sheet breakers, and osmolytes, have been used to prevent or to reduce the aggregation of $A \beta$ into oligomers or fibrils [9]. In this study we isolated several compounds from the A. Caulis and examined against $\mathrm{A} \beta 42$ induced fibrilogenesis.

### 1.2. Akebiae Caulis:

Fig. 5: Akebia Quinata; Leaves, Flowers, Fruits
Akebia quinata DECAISENE (Lardizabalaceae), commonly referred to as chocolate vine, grows naturally in Japan, China, and Korea. The dry ripe fruit and stem of Akebia quinata is used as an analgesic, an antiphlogistic, and a diuretic in traditional Chinese medicine [10]. And also used as ingredients of a traditional Korean weight-loss tea as a folk remedy [13]. Regarding the biological activity of Akebia quinata extract has been shown to have antioxidant activity and free radical scavenging capability [11] cytotoxicity against cancer cells [12] anti-obesity and hypolipidemic effects [13] antiatherogenic effects [14] Antinociceptive effect [15] and IL-6 inhibitory activity [16].

Previous phytochemical investigations resulted in the isolation of triterpenes, triterpene glycosides, and phenylethanoid glycosides [17-19], lignan glycoside [16], megastigmane glycoside [20].

Here the stem of Akebia quinata (known as Akebiae Caulis) was extracted and fractionated further into the $\mathrm{nBuOH}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, Hexane and EtOAc fractions. This experiment was carried out to identify the chemical constituents from EtOAc fraction of Akebiae Caulis. And in this study, we investigated the effect of isolated compounds from Akebiae Caulis in A $\beta 42$-induced fibrillogenesis. However, isolation and identification of constituents from EtOAc fraction of this plant and its
inhibitory activity has not reported yet. By activity oriented purification procedure, we therefore now report nine (9) compounds were isolated from the EtOAc fraction of Akebiae Caulis. For this isolated compound, the inhibitory activities of A $\beta 42$ induced fibrillogenesis were examined. The chemical structures of compounds (19) were identified based on 1D and 2D NMR, including H-H COSY, HSQC, and HMBC spectroscopic analyses. The results are described in this thesis.

Fig. 6: Akebia Quinata; stem (known as Akebiae Caulis)

## 2．Materials and Methods

## 2．1．Materials

## 2．1．1．Plant Material

The stem（Akebiae Caulis）of A．quinata were collected in Gyeongju，Gyeongbuk province，Korea，in August 2011 and identified by Dr．J．H．Lee，Professor of the department of Korean Medicine，Dongguk University．A voucher specimen（CSU－ 877－17）has been deposited in the Herbarium of the College of Pharmacy，Chosun University．

## 2．1．2．Chemicals，reagents and chromatography

TLC and column chromatography were performed on pre－coated Silica Gel F plates（Merck，art．5715），RP－18F plates（Merck，art．15389）and silica gel 60 （40－ 63 and 63－200 mm，Merck），MCI gel CHP20P（ $75-150 \mathrm{~m}$ ，Mitsubishi Chemical Co．），Sephadex LH－20（25－100 $\mu \mathrm{m}$ ，Sigma）as well as LiChroprep RP－18（40－63 $\mu \mathrm{m}$ ，Merck）and MPLC（Grace，USA，Reveleris flash Chromatography system，Part No．5148513）．Low pressure liquid chromatography was carried out over a Merck Lichroprep Lobar ${ }^{\circledR}$－A RP－18（240 910 mm ）column with a FMI QSY－0 pump （ISCO）．

Phosphate－buffered saline（PBS）［10 mM phosphate buffer（ pH 7.4 ）， 137 mM NaCl ， and 2 mM KCl ］was purchased from Amresco（Solon，OH）．Fetal Bovine Serum （FBS）were purchased from Welgene（Daegu，Korea）．All other chemicals were obtained from Sigma（St．Louis，MO）unless otherwise stated．

### 2.2. Methods

### 2.2.1. General experimental procedures

Optical rotations were measured using an Autopol-IV polarimeter. IR spectra were recorded on an IMS 85 (Bruker). CD spectra were recorded on a JASCO J-810 spectropolarimeter. HR-ESI-MS spectra were obtained on a Q- TOF (Synapt HDMS system, Waters, USA) mass spectrometer. NMR spectra, COSY, heteronuclear single quantum coherence (HSQC) and HMBC experiments, were recorded on a Varian UNITY INOVA 500 NMR spectrometer (KBSI - Gwangju center) operating at 600 and 500 MHz for both ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$, with chemical shifts given in ppm $(\delta)$. Semi-preparative HPLC was performed using a Waters HPLC system equipped with Waters 600 Q-pumps, a 996 photodiode array detector, and an YMC-Pack ODS-A column ( $250 \times 10 \mathrm{~mm}$ i.d., $5 \mu \mathrm{~m}$ ), flow rate $4.0 \mathrm{~mL} / \mathrm{min}$.

### 2.2.2. Extraction and Isolation

### 2.2.2.1 Extraction

The air-dried stem of Akebiae Caulis ( 11 kg ) were cut and extracted with MeOH three times for 4 h at $80^{\circ} \mathrm{C}$. The resultant MeOH extract ( 480 g ) was suspended in water (1.5 L×3) and then partitioned sequentially with equal volumes of dichloromethane, ethyl acetate, and $n$-butanol. Each fraction was evaporated in vaccuo to yield the residues of $\mathrm{CH}_{2} \mathrm{Cl}_{2}(45.2 \mathrm{~g}), \mathrm{EtOAc}(11.0 \mathrm{~g}), n-\mathrm{BuOH}(57.0 \mathrm{~g})$, and water ( 150.3 g ) extracts (Scheme. 1).

Scheme 1: Extraction and fraction of EtOAc fraction from Akebiae Caulis

### 2.2.2.2. Isolation

The EtOAc fraction ( 05.0 g ) was chromatographed over a MPLC, using a gradient solvent system of $\mathrm{CHCl}_{3}: \mathrm{MeOH}: \mathrm{H}_{2} \mathrm{O}=(9: 1: 0.1)$, to give ten subfractions ( $\mathrm{F} 1 \sim$ F10) (Scheme. 2).

Scheme 2: Isolation of compound 1-9 from EtOAc fraction of Akebiae Caulis

## Compound 1:

The subfraction F-7 ( 682.33 mg ) was subjected to a Silica-gel column chromatography ( CC ) eluting with an isocratic solvent system of $\mathrm{CHCl}_{3}: \mathrm{MeOH}$ : $\mathrm{H}_{2} \mathrm{O}$ (9:1:0.1) to yield six subfractions (F-7-1 ~ F-7-6). The subfraction F-7-3 ( 263.22 mg ) was subjected to Lichroprep RP-18 Column chromatography eluting with an isocratic solvent system of $\mathrm{MeOH}: \mathrm{H}_{2} \mathrm{O}$ (3: 1) to produce compound 1 (14.23mg).

## Compound 9:

The subfraction F-6 ( 928.28 mg ) was subjected to MPLC eluting with an isocratic solvent system of $\mathrm{CHCl}_{3}$ : MeOH: H 2 O (9:1:0.1) to yield five subfractions (F-6-1 ~ F-6-5). The subfraction F-6-2 ( 195.81 mg ) was subjected to MCI-gel column chromatography (CC) eluting with an isocratic solvent system of MeOH: H 2 O (4:1) to yield five subfractions (F-6-2-1 ~ F-6-2-5). Therefore, subfraction F-6-2-2 ( 26.56 mg ) was subjected to Lichroprep RP-18 Column chromatography to elute with an isocratic solvent system of MeOH : H 2 O (3:1) to produce compound 9 2.56 mg ).

### 2.2.3. Preparation of amyloid beta solution

Amyloid beta peptides were expressed in E. coli as fusion proteins and purified as described before [21]. The purified peptides were solubilized in $100 \% 1,1,1,3,3$, 3 , - hexafluoro-2-propanol, and dried under nitrogen flow and subsequently, under a vacuum for 30 min . The peptide aliquots were stored at $-20^{\circ} \mathrm{C}$ until use. Immediately before use, the peptides were dissolved in $0.1 \% \mathrm{NH}_{4} \mathrm{OH}$ at a concentration of $2 \mathrm{mg} / \mathrm{ml}$ followed by bath sonication for 10 min at $4^{\circ} \mathrm{C}$. The solution was diluted at the desired concentration with PBS.

### 2.2.4. Thioflavin T Binding Assay for the Study of Aß42 Fibrillogenesis.

For the polymerization assay, $\mathrm{A} \beta 42(20 \mu \mathrm{M})$ was incubated in PBS at $37^{\circ} \mathrm{C}$ in the presence or absence of compound (1-8) in a final volume of $30 \mu \mathrm{l}$ without shaking. Twenty $\mu \mathrm{l}$ from each reaction was mixed with $80 \mu \mathrm{l}$ of $5 \mu \mathrm{M}$ Th-T in PBS solution. Fluorescence was measured on a microplate spectrofluorometer Gemini-XS (Molecular Devices CA, USA) using excitation at 440 nm and emission at 490 nm [22].

## 3. Results and Discussion

### 3.1. Structure determination of isolated compounds from Akebiae Caulis

The structures of compounds (1-9) were identified based on 1D and 2D NMR, including H-H COSY, HSQC, HMBC spectroscopic analyses.

### 3.1.1. Compound 1

Compound 1 was obtained white amorphous powder and molecular formula was determined as $\mathrm{C}_{41} \mathrm{H}_{66} \mathrm{O}_{12}$ by ESI-MS: m/z $749.6[\mathrm{M}-\mathrm{H}]^{-}$, IR (KBr) $\mathrm{cm}^{-1}: 3419$ $(\mathrm{OH}), 1687(-\mathrm{C}=\mathrm{O}), 1637(-\mathrm{C}=\mathrm{C}-)$. The ${ }^{13} \mathrm{C}$ NMR and HSQC data compound 1 showed 41 carbon and expected triterpenoid typed compound. From the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ data compound 1 showed seven methyl group at $\delta_{\mathrm{H}} 0.97(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-24), \delta_{\mathrm{H}} 0.70$ $(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-25), \delta_{\mathrm{H}} 0.82(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-26), \delta_{\mathrm{H}} 1.17(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-27), \delta_{\mathrm{H}} 0.91$ ( $3 \mathrm{H}, \mathrm{s}, \mathrm{H}-29$ ), $\delta_{\mathrm{H}} 0.94(3 \mathrm{H}, \mathrm{s}, \mathrm{H}-30)$, and sugar methyl at $\delta_{\mathrm{H}} 1.24(3 \mathrm{H}, \mathrm{s}$, Rha-H-6). At the same time, in the spectra of compound 2 we found with the aid of COSY two doublet signals of protons, having a spin-spin coupling with one another, from the chemical shifts, which corresponded to $\alpha \beta$ protons in a $\mathrm{CH}_{2} \mathrm{OH}$ group at the $\mathrm{C}-23$ atom. There is a carboxyl group at $\delta_{\mathrm{C}} 179.41$ (C-28). From the carbon NMR data the spectrum showed two chemical shifts at 104.49 and 102.04 , which referred two sugars moiety. Based on the above results, the structure of compound 1 was identified as Pulsatilla saponin $\mathbf{A}$ or $3-\mathrm{O}-\alpha$-L-Rhamnopyranosyl-(1 $\rightarrow 2$ )- $\alpha$-Larabinopyranosyl hederagenin by comparing ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ data with those reported in the literature [23] [24].

### 3.1.2. Compound 2

Compound 2 was obtained Colorless needle and molecular formula was determined as $\mathrm{C}_{41} \mathrm{H}_{66} \mathrm{O}_{13}$ by EI-MS: m/z $767[\mathrm{M}+\mathrm{H}]^{+}, 605\left[\mathrm{M}+\mathrm{H}-\mathrm{glc}\left(\mathrm{C}_{6} \mathrm{H}_{11} \mathrm{O}_{5}\right)\right]^{+}$,
$472\left[\mathrm{M}+\mathrm{H} \text {-glc-ara }\left(\mathrm{C}_{11} \mathrm{H}_{19} \mathrm{O}_{9}\right)\right]^{+}, 471$ [M-glc-ara] ${ }^{+}, 455\left[\mathrm{M}+\mathrm{H}\right.$-glc-ara-OH] ${ }^{+}$. IR (Nujol) $v_{\text {max }} 3660,3500,3420,3300,1690,1620,1460,1375,1300,1265,1240$, $1210,1200,1170,1130,1090,1060,1030,1000$, and $785 \mathrm{~cm}^{-1}$. The 1 H and the 13 C nmr spectra showed signals for six quaternary methyls: ${ }^{1} \mathrm{H}-\mathrm{nmr}$ signals at $\delta$ $0.72,0.82,0.91,0.94,0.98,1.17$ (each $3 \mathrm{H}, \mathrm{s}$ ) and ${ }^{13} \mathrm{C}-\mathrm{nmr}$ signals at 33.77, 26.47, 24.17, 17.98, 16.58, and 13.50 ppm . The spectra also exhibited signals due to the following groups at positions similar to those of hederagenin: a carboxylic acid group ( $\delta 182.22$ ), a trisubstituted double bond ( $\delta 123.59$ and 145.55 , a proton signal at $\delta 5.24 \mathrm{br}$, s), a primary alcoholic group ( $\delta 65.26$, proton signals at $\delta 3.35$ and 4.34 each $(1 \mathrm{H}, \mathrm{m})$ and a secondary alcoholic hydroxyl group ( $\delta 83.64$, proton signal at $\delta 3.61, \mathrm{~m})$. The anomeric carbons at $\delta 106.27$ and 105.64 in collinsonidin indicated the presence of two sugar units. The arabinosyl unit was shown to be directly attached at C-3 of the aglycon by a heteronuclear multiple bond correlation between the signals of the anomeric proton of the arabinosyl unit at $\delta 4.54$ and $\mathrm{C}-3$ of the aglycon at d 83.64. Based on the above results, the structure of compound 2 was identified as Collinsonidin or Hederagenin 3-O- $\beta$-D-glucopyranosyl-( $1 \rightarrow 3$ )- $\alpha-$ L-arabinopyranoside by comparing ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ data with those reported in the literature [25].

### 3.1.3. Compound 3

Compound 3 was obtained white amorphous powder and molecular formula was determined as $\mathrm{C}_{29} \mathrm{H}_{44} \mathrm{O}_{3}$ by EI-MS ( 70 eV ): $440\left(40, \mathrm{M}^{+}\right), 422\left(10,\left[\mathrm{M}-\mathrm{H}_{2} \mathrm{O}\right]^{+}\right), 394$ (29, [M-HCOOH] ${ }^{+}$), 248 (58), 232 (84), 219 (34), 207 (65), 187 (78), 175 (53), 145 (44), 131 (55), 107 (54), 91 (64), 69 (77). The 1 H and the 13 C nmr spectra showed signals for five quaternary methyls: ${ }^{1} \mathrm{H}-\mathrm{nmr}$ signals at $\delta 0.82,0.84,0.93$, $0.96,1.22$ (each 3 H, s) and ${ }^{13} \mathrm{C}$-nmr signals at 29.00, 26.35, 24.17, 17.87, 15.90, and 14.58 ppm . The spectra also exhibited signals due to the following groups a
carboxylic acid group ( $\delta 181.37$ ), a trisubstituted double bond ( $\delta 124.27$ and 144.81, a proton signal at $\delta 5.31 \mathrm{br}, \mathrm{s}$ ), and a secondary alcoholic hydroxyl group ( $\delta 77.01$, proton signal at $\delta 3.33$, br, s). Further, the low field carbon signals at $\delta 149.98 \mathrm{ppm}$ and 107.28 ppm were assigned to the exomethylene $\mathrm{C}-20$ and $\mathrm{C}-29$ respectively. Based on the above results, the structure of compound 3 was identified as Akebonic acid or 30-Noroleana-12,20(29)-dien-28-oic acid, 3-hydroxy-, (3ß)- by comparing ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ data with those reported in the literature [26].

### 3.1.4. Compound 4

Compound 4 was obtained white amorphous powder and molecular formula was determined as $\mathrm{C}_{30} \mathrm{H}_{48} \mathrm{O}_{4}$ by ESI-MS: m/z 472 [M] ${ }^{+}$(18), 248 (100), 203 (66). The chemical shifts and DEPT experiment suggested that it was a $\mathrm{CH}_{2} \mathrm{OH}$ group. In the HMBC experiment, H-23 showed long-range correlation with C-3, C-4, C-5 and C24 and thus structural unit could be proposed. In the COSY experiment, H-3 showed a $J$ correlation with $\mathrm{H}-2$, thus, from the HMBC spectra $\mathrm{H}-2$ showed longrange correlation with $\mathrm{C}-4$ and $\mathrm{C}-10$. Based on the above results, the structure of compound 4 was identified as Hederagenin or Olean-12-en-28-oic acid, 3,23-dihydroxy-, $(3 \beta, 4 \alpha)$ - by comparing ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ data with those reported in the literature [27] [28]. Hederagenin is the well-known structure.

### 3.1.5. Compound 5

Compound 5 was obtained brown powder and molecular formula was determined as $\mathrm{C}_{14} \mathrm{H}_{16} \mathrm{O}_{6}$ by EIMS $m / z 281$ (10), $[\mathrm{M}+\mathrm{H}]^{+} 180$ (20), 163 (82). Signals at $\delta$ $149.64,146.92,127.92,123.09,115.62$, and 115.25 in the ${ }^{13} \mathrm{C}$ NMR of compound 5 were typical of a $3^{\prime}, 4^{\prime}$-dihydroxylcinnamoyl group. The signals at $\delta 74.86,73.16$, and 72.51 were assigned to the hydroxymethine carbons $\mathrm{C}-1, \mathrm{C}-2$, and $\mathrm{C}-3$. The ${ }^{1} \mathrm{H}$

NMR of compound 5 revealed two aromatic protons appearing as doublets at $\delta$ $7.56\left(J=15.8 \mathrm{~Hz}, \mathrm{H}-7^{\prime}\right)$ and $6.28\left(J=15.8 \mathrm{~Hz}, \mathrm{H}-8^{\prime}\right)$, the coupling constant of which suggested that they were trans-oriented. The presence of a caffeic acid moiety in compound 5 was confirmed from peaks at $m / z 180$ and 163 in the EIMS, while those at $\delta 146.8$ and $\delta 115.3$, together with correlations indicated by the gHMBC spectrum between $\mathrm{H}-7{ }^{\prime}$ and $\mathrm{H}-8^{\prime}$ with the carbonyl group at $\delta 168.7$. The multiple signals at $\delta 5.38(\mathrm{H}-1)$ and $4.18(\mathrm{H}-3)$ together with the doublet of doublets at $\delta 3.69(\mathrm{H}-2)$ were attributed to three hydroxymethine hydrogens. Based on the above results, the structure of compound 5 was identified as $\mathbf{1 - ( 3 ^ { \prime }}, \mathbf{4}^{\prime}$ dihydroxycinnamoyl) cyclopentane-2, 3-diol by comparing ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}$ NMR data with those reported in the literature [29].

### 3.1.6. Compound 6

Compound 6 was obtained white amorphous powder and molecular formula was determined as $\mathrm{C}_{35} \mathrm{H}_{56} \mathrm{O}_{7}$ by Negative ESI-MS m/z 587 [M-H] ${ }^{-}$; Negative TOF-MS $\mathrm{m} / \mathrm{z} 587.3996[\mathrm{M}-\mathrm{H}]^{-}$. The downfield chemical shift of C-3 ( $\delta \mathrm{C} 90.82$ ) in the ${ }^{13} \mathrm{C}$ NMR spectra implied that compound 6 is a monodesmosidic glycoside with sugar moiety at C-3. The coupling constants $(6.0 \mathrm{~Hz})$ of the anomeric protons suggested that arabinose has an $\alpha$-anomeric orientation. The proton and carbon signals were assigned unambiguously using ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, HSQC, HMBC, NOESY NMR experiments. Thus, the structure of compound 6 was determined as 3-O- $\alpha$-L-arabinopyranosyl oleanolic acid. The aglycon of compound 6 was identified as oleanolic acid and sugar moiety was an arabinose named Asperosaponin $\mathbf{C}$ or $3-\mathrm{O}-\alpha-\mathrm{L}-$ arabinopyranosyl oleanolic acid by comparison of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data with literature values [30].

### 3.1.7. Compound 7

Compound 7 was obtained white amorphous powder and molecular formula was determined as $\mathrm{C}_{35} \mathrm{H}_{56} \mathrm{O}_{8}$ by FD-MS: m/z $627[\mathrm{M}+\mathrm{Na}]^{+}$. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum of compound 7 exhibited anomeric signal at $\delta 4.31\left(1 \mathrm{H}, \mathrm{d}, \mathrm{J}=6.00 \mathrm{~Hz} \mathrm{H}-1^{\prime}\right)$ indicating the presence of one sugar moiety. The ${ }^{13} \mathrm{C}$-NMR spectrum suggested that the aglycone of compound 7 is an oleanane-type triterpene. The olefinic resonances at $\delta 145.44$ and 123.70 corresponding to quaternary and methine behavior revealed the presence of unsaturation at $\mathrm{C}-12$ in an oleanane skeleton. The ${ }^{13} \mathrm{C}$-NMR spectrum further showed anomeric carbon signals at $\delta 106.45$ which indicated the presence of one sugar moiety. This suggested that compound 7 should be a hederagenin glycoside containing only one arabinosyl. C-23 was assigned to $\delta$ 64.96 as this was close to the assignment in hederagenin. From the ${ }^{13} \mathrm{C}$ NMR and ${ }^{1}$ H NMR spectra, it can be concluded that the structure of compound 7 was hederagenin 3-0- $\alpha$-L-arabinopyranoside, which was identical to Leontoside A or 3-O-[ $\alpha$-L-Arabinopyranosyl] hederagenin, previously isolated from literature [31] [32].

### 3.1.8. Compound 8

Compound 8 was obtained colorless powder and molecular formula was determined as $\mathrm{C}_{29} \mathrm{H}_{44} \mathrm{O}_{4}$ by ESI-MS: $(+) \mathrm{m} / \mathrm{z} 479[\mathrm{M}+\mathrm{Na}]^{+} ;(-) \mathrm{m} / \mathrm{z} 455[\mathrm{M}-\mathrm{H}]^{+}$. The ${ }^{1} \mathrm{H}$ and the ${ }^{13} \mathrm{C} \mathrm{nmr}$ spectra showed signals for four quaternary methyls: ${ }^{1} \mathrm{H}$ nmr signals at $\delta 0.81,0.92,1.04,1.22$ (each $3 \mathrm{H}, \mathrm{s}$ ) and ${ }^{13} \mathrm{C}-\mathrm{nmr}$ signals at 26.62, $22.98,17.84$, and 16.32 ppm . The spectra also exhibited signals due to the following groups a carboxylic acid group ( $\delta 182.19$ ), a trisubstituted double bond ( $\delta 123.97$ and 145.06 , a proton signal at $\delta 5.30 \mathrm{br}$, s), and a secondary alcoholic hydroxyl group ( $\delta 71.44$, proton signal at $\delta 3.77$, br, s). Further, the low field carbon signals at $\delta 150.25 \mathrm{ppm}$ and 107.08 ppm were assigned to the exomethylene

C-20 and C-29 respectively. Based on the above results, the structure of compound 8 was identified as Quinatic acid or 30-Noroleana-12,20(29)-dien-28-oic acid, 3, 23-dihydroxy-, $(3 \alpha, 4 \beta)$ by comparing ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}$-NMR data with those reported in the literature [27].

### 3.1.9. Compound 9

Compound 9 was obtained colorless powder and molecular formula was determined as $\mathrm{C}_{34} \mathrm{H}_{52} \mathrm{O}_{8}$ by EIMS: m/z $456[\mathrm{M}-142]^{+}$(3), 410 (3), 232, 207 (23), 187 (100), 176 (25). 13CNMR spectrum of compound 9 showed the presence of two olefinic bonds. One of them was located at C-12 ( $\delta 123.91$ ) and C-13 ( $\delta 145.17$ ) and the other signals appeared at $\delta 150.26$ and $\delta 107.08$ indicating the presence of an exomethylene group. On the other hand, the ${ }^{13} \mathrm{C}$ NMR spectrum of 1 showed the presence of only one anomeric carbon signal at $\delta 106.49$ and the five carbon signals of a sugar moiety, which were identical with those reported for an $\alpha$-L-arabinosyl moiety named as Quinatoside A or 3-O- $\alpha$-L-arabinopyranosyl-3-norhederagenin [33].

Fig. 7: Structures of compound 1-9 from Akebia Caulis.

### 3.2. Inhibition of A $\beta 42$ induced fibrilogenesis

To examine the effects of compound 1-8 on fibril formation of $A \beta 42,20 \mu \mathrm{M}$ of peptide was incubated in the presence of $40 \mu \mathrm{M}$ concentrations of compound 1-8 and Th-T assay was performed for measurement of fibrillogenesis activity. Before testing the isolated compound 1-8 from EtOAc fraction of Akebiae Caulis, the crude fractions $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and EtOAc of Akebiae Caulis and MeOH fraction of Angelica keiskei was experimented on Aß42 induced fibrilogenesis (Fig.8.) and EtOAc fraction showed significant activity. The fluorescence profiles of A $\beta 42$ aggregation with $40 \mu \mathrm{M}$ concentration of compound 1-8 are shown in Fig. 9 \& 10 . A $\beta 42$ alone showed a characteristic sigmoidal curve when incubated at $37^{\circ} \mathrm{C}$ for 6h [34]. In the presence of $40 \mu \mathrm{M}$ of compound 1-8, the final fluorescence level indicative of the amount of mature fibrils formed. The data suggested that, compound 2, 3, 4 and 6 showed significant activity and compound 1,5 and 7 have moderate activity.

Fig. 9. Inhibitory effect of compound 1-4 on AB42 induced fibrilogenesis

Fig. 10. Inhibitory effect of compound 5-8 on AB42 induced fibrilogenesis

## 4. Conclusion

Beta-amyloid peptides, specifically $A \beta 42$, are the principal species deposited in the brain and more hydrophobic and fibrillogenic. And cause protofibrils and fibrils to form the well-known plaque, which are the basic features of Alzheimer's disease (AD). In this study, to inhibit the A $\beta 42$ induced fibrilogenesis, the isolated active compounds from EtOAc fraction of Akebiae Caulis were examined. As the active constituents, eight triterpenoid saponins, named Pulsatilla saponin A (1), Collinsonidin (2), Akebonic acid (3), Hederagenin (4), Asperosaponin C (6), Leontoside A (7), Quinatic acid (8), and Quinatoside A (9) and one quinic acid derivatives 1-(3', 4'-dihydroxycinnamoyl) cyclopentane-2, 3-diol (5), were isolated from this plant through activity-guided isolation. From the study, Collinsonidin (2), Akebonic acid (3), Hederagenin (4), and Asperosaponin C (6), showed potent inhibitory effect on $A \beta 42$ induced fibrilogenesis and considering Pulsatilla saponin A (1), 1-(3', 4'-dihydroxycinnamoyl) cyclopentane-2, 3-diol (5) and Leontoside A (7), pointed the effect moderately. This is the first report on the inhibitory effect of the isolated components from Akebiae Caulis against fibrilogenesis The observation of this study suggest that the isolated compounds, especially compound $2,3,4$, and 6 might be suppress the plaque formation by $A \beta 42$. And that the active constituents of Akebiae Caulis could be considered as nontoxic source for development of agents against Alzheimer's disease (AD).

## ACKNOWLEDGEMENTS

I am using this opportunity to express my gratitude to everyone who supported me throughout the journey of my master's degree. There were so many meaningful moments I cannot forget and so many people I have to thank.

At first and at most I would like to express my deep and sincere gratitude to my supervisor, Professor Woo Eun-Rhan, for her advice, guidance, and knowledge throughout this thesis as well as my study in lab, in both good and hard times when I lived and studied in South Korea and for the financial supports I got throughout my study period. She is an extraordinary human being who can guide a student with patience and perseverance. She is also concerned about my future and supports me to do any programs that are beneficial to my future. It is a great privilege for me, and I believe, for all of those who have ever had an opportunity to work under her guidance.

I feel grateful to all the professors at College of Pharmacy, Chosun University who once offered me valuable courses and advice during my study.

I also wish to thank my colleagues Kim A Ryun, Ko Hae Ju and Kim Jeong-a, who made my experience a joyful one and with whom I have shared the hardship, daunting difficulties and excitements during the working time. I am thankful to them for their excellent assistance and significant contribution.

I am greatly indebted to my parents, Akramul Haq Chowdhury and Joinab Akther Chowdhury, who are the greatest persons in my heart. Their unconditional love and encouragement have always been the invariants of my life.

I would like to thank to all my friends in Chosun University for their sincere and enthusiastic helps in my work and my life.

Last but not the least; nothing was possible without the command of ALLAH. He
showed me the path to success and I am walking on that path. In brief, I deeply appreciate all of the professors, relatives, colleagues, and friends who have helped me a lot. I sincerely wish them all the best in their lives.
